MINERAL PRODUCTION IN ILLINOIS IN 1958

W. L. Busch

ABSTRACT

The amount and value of minerals produced in Illinois during 1958 and 1957 are summarized in tables, maps, and charts in this annual report. The total value of minerals produced in 1958 amounted to more than 603 million dollars. Revised values for 1957 totaled 612.7 million dollars. The minerals include coal, crude oil, stone, sands and gravel, fluorspar, metals, and such related items as clay products, cement, lime, natural gas, and liquefied petroleum gases. A directory of Illinois mineral producers is included.

INTRODUCTION

"The Illinois mineral industry is a key factor in creating and supporting the industrial activity in Illinois and, to a considerable extent, in other states of the Upper Mississippi Valley. The primary materials of industrial production - fuels and iron ore, the latter from the Lake Superior district - are available in abundant quantities and are assembled for processing at a low cost on Lake Michigan near the large market of Chicago and of smaller cities in the industrial belt. There are abundant cheaply mined and good quality coals at points accessible to manufacturing centers. In addition to this, certain minerals essential to the processing of primary steel, such as refractory materials and fluxes, are also present in the area, together with a variety of mineral products for foundry, chemical, construction, and other uses.

"This wide array of manufacturing industries lies in the center of one of the most efficient and low-cost food producing areas in the United States, if not in the world. A fertile soil has provided an area of high food yields, a mechanized agriculture has brought production costs down to a low level, a flat topography has aided in the introduction of cost-saving farm machinery and the low cost of transporting farm products to consuming centers, and the use of power on farms, by displacing animal power, has added millions of acres to the farm land available for the production of food.

"The unusual and excellent endowment of industrial, mineral, and agricultural resources offers opportunities for production and employment that are probably unmatched elsewhere."

ACKNOWLEDGMENT

Dr. Walter H. Voskuil, Principal Mineral Economist of the Illinois State Geological Survey, fifteen years ago wrote the introductory statement reprinted above. It first appeared in the 1944 annual report of the Illinois mineral industry (Report of Investigations 109). Time has proved the accuracy of his analysis and

the clarity of his vision concerning the Illinois industrial, mineral, and agricultural endowment.

Dr. Voskuil, who has been Head of the Mineral Economics Group of the Illinois State Geological Survey since 1931, is the author of many studies in the field of mineral economics, studies that encompass not only the state and regional scene, but also the national and international.

Special acknowledgment is made to Dr. Voskuil at this time by associates who have had the opportunity of working under his leadership, and by many others who have known him personally or scholastically. During 1960 Dr. Voskuil plans to retire from official duty. However, this action means only additional opportunity for Dr. Voskuil to pursue more vigorously than ever studies in the field of mineral economics.

ILLINOIS MINERAL INDUSTRY

This report records the extent and depth of the Illinois mineral industry which, although not as well known as the state's dynamic manufacturing industry and rich agriculture, has grown in annual value from less than 300 million dollars in 1940 to more than 600 million dollars in each of the years 1956 to 1958.

Of all the mineral products produced in this state, none are more important for manufacturing, transportation, and for the production of food than the fossil fuels, coal and oil. These minerals account for about 70 percent of the value of Illinois mineral output.

Abundant industrial minerals such as sand, gravel, stone, cement- and lime-making materials furnish supplies for the construction industries and account for about 18 percent of the value of Illinois mineral production.

Accounting for the remaining 12 percent of the total value of Illinois mineral products are several other minerals.

Refractory clays and clays for pottery making are produced in important quantities. Illinois is also the nation's leading producer of fluorspar, a mineral important in the steel, chemical, aluminum, and ceramics industries. Also produced in Illinois are the metals zinc and lead, and occasional small quantities of silver.

Table 1 gives a complete summary of the Illinois mineral industry for 1957 and 1958 (fig. 1), listing the various minerals produced, their amounts, and total values. The value of these minerals has exceeded the half-billion dollar mark since 1950. Table 2 shows the complete record of the total value of minerals produced in Illinois for each year from 1914 through 1958. Figure 2 compares graphically the total mineral output for the years 1952-1958. Average prices at the source are given in table 3 for each of twelve different Illinois mineral products for the

fig. 1. - Value of Illinois mineral production in 1958 was \$603,793,000. Percentage contributions by the various segments of the Illinois mineral industry are shown above.

fifteen year period 1943 through 1957. Further information regarding many of the mineral products of Illinois will be found in the included tables, charts, and maps.

COAL INDUSTRY

Illinois for many years has ranked as the fourth largest coal producing state in the nation (table 8). The only states that produce greater tonnages of coal are West Virginia, Pennsylvania, and Kentucky (fig. 3). During 1958 Illinois produced more than 43.7 million tons of coal, more than 10 percent of all the coal produced in the United States.

The value of the coal produced in Illinois during 1958 was estimated at over

Table 4. - Percentage of Total Value Contributed by Various Segments of the Illinois Mineral Industry, 1943-1957^a

Year	Coal	Petroleum products	Stone products	Clay products	Sand and gravel	Fluorspar and metals	Total percent

177 million dollars, or about 29 percent of the entire value of the mineral output of the state. Although the annual value of crude oil produced in Illinois has exceeded the annual value of coal in recent years (table 4), the vast coal reserves and nearby markets assure a long future for the Illinois coal industry. In fact, the calculated reserves of minable bituminous coal in Illinois, amounting to some 137 billion tons, exceed those of any other state.

Production

The record of coal production in Illinois for 1958 is shown in tables 5, 6, and 7. Table 5 summarizes the 1958 production record by giving a complete county by county tabulation of coal produced, type of mining (strip or underground), number of mines, and the approximate value of the product. It also shows that of the 37 coal-producing counties, 13 produced more than one million tons each for a combined total of about 90 percent of the state's output for 1958 (fig. 4).

Coal production by stripping methods, important in only a few counties a decade ago, predominated in a number of counties during 1958. In fact, the total quantity of coal produced by this method in Illinois during 1958 was 20.6 million tons, or 47 percent of the state's entire output. Table 5 indicates the counties where this method of mining was important.

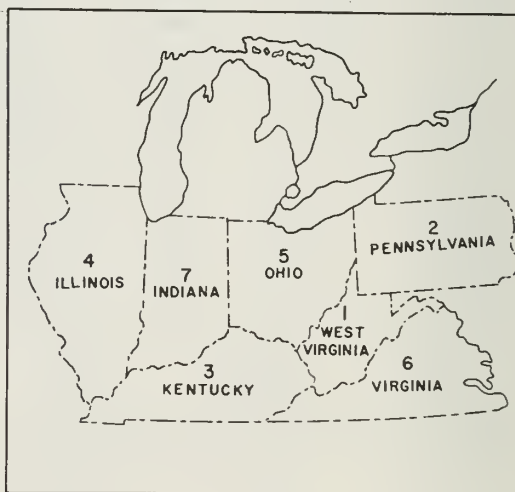

Fig. 3. - States that produced 90 percent of the nation's bituminous coal in 1958.

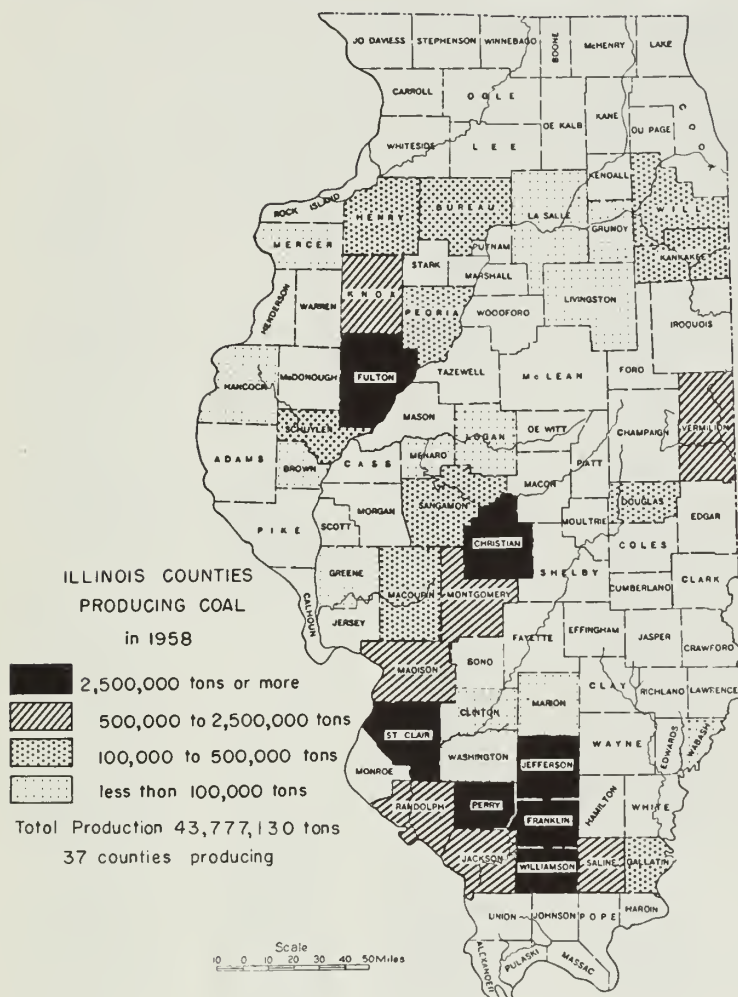

Fig. 4. - Illinois coal production by counties in 1958.

The accumulated production of coal by counties since 1882, when mining records were begun, is shown in table 6. Of the 70 counties that have a coal production record during this 77-year period, 11 counties have accounted for three-fourths of the state's entire output, each producing more than 100 million tons of coal. Table 6 also records the total number of years that each county has produced coal since 1882 and the last year it produced coal.

Table 7 brings up to date the historical record of Illinois coal production. The complete year by year, county by county, Illinois coal production from 1882 through 1947 was recorded in the Survey's Illinois mineral report for 1947 (Report of Investigations 140, table 14). Table 7 of this report records the total coal produced by each Illinois county, 1882-1947, and also lists the coal production for each of these same counties for the eleven year period 1948 through 1958. Tables 6 and 7 each show a grand total of more than 3.5 billion tons of coal produced in Illinois during the 77-year period, 1882-1958.

PETROLEUM INDUSTRY

As a producer of crude oil, Illinois not only ranks among the top ten producing states of the United States by holding eighth position but is the leading producer of oil among the states lying wholly east of the Mississippi River. Table 13 shows that the state of Texas is the top producer of crude oil in the nation. In fact, the next four oil producing states - California, Louisiana, Oklahoma, and Kansas - would have to combine their production to equal the Texas output. The remaining five of the nation's first ten oil producers - Wyoming, New Mexico, Illinois, Colorado, and Mississippi - are comparatively small producers.

Table 14 indicates the estimated crude oil reserves in Illinois and in some other states, and table 15 gives the estimated natural gas reserves known in the several states listed. Each year the industry makes a survey of the amount of oil or gas reserve known to exist and that can be produced under current conditions of price and production practices. The figures given in these tables represent only known amounts of oil or gas on a given date.

Production

For 1958, Illinois crude oil, together with the associated products, gas and liquefied petroleum gases, accounted for about 41 percent of the state's total mineral product. Oil production in Illinois for 1958 was estimated to be 80,779,000 barrels, or some four million barrels more than was produced in 1957. The average value for Illinois oil was estimated at \$3 per barrel for 1958, bringing its total value to more than 242 million dollars.

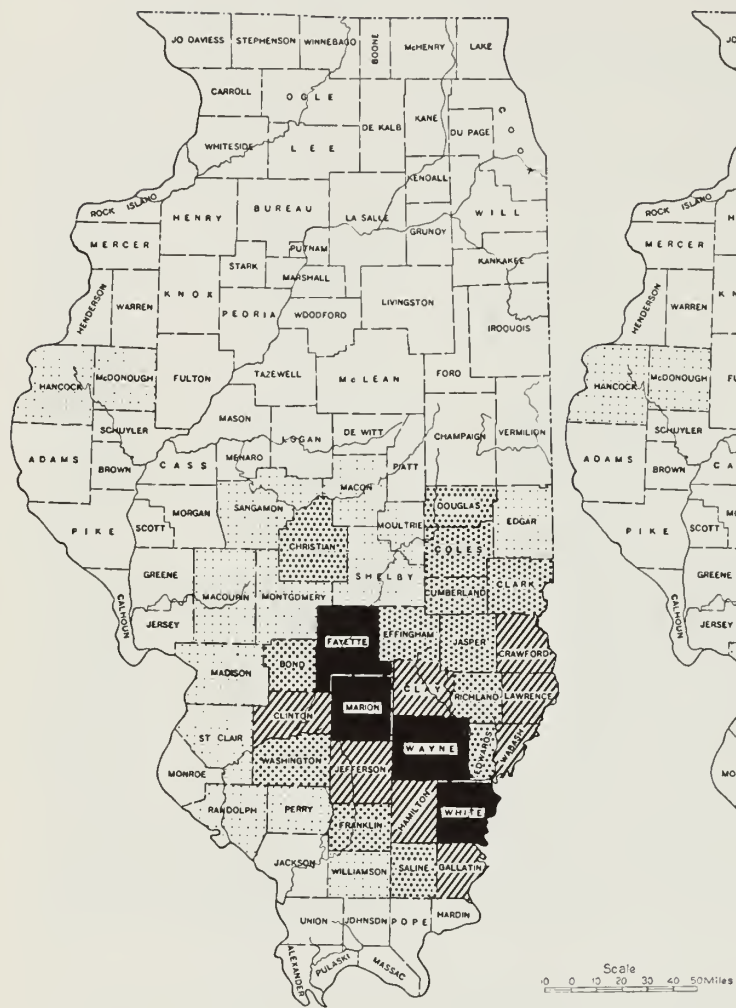

Fig. 5. - Illinois production of crude petroleum, 1905-1958.

Table 9 gives a summary of well completions and production since 1936, the year just prior to the beginning of increased activity in Illinois oil fields (fig. 5). Illinois fields that produced more than one million barrels of oil each during 1958 are listed in table 10. This table also names the twelve oil fields in Illinois that produced more than two-thirds of the state's total oil production.

Of special interest are table 11 and figure 6. The table gives the estimated amount of oil produced from Illinois counties for the year 1957. The percentage of the state's total oil that each county produced and its approximate value also is shown. The map (fig. 6) shows the concentration of oil production throughout the state during 1957. Of equal interest and importance are table 12 and figure 7. Production figures, percent of total, and values for each oil producing county in Illinois for 1958 are given in the table, and the figure shows the areas of oil production for 1958.

Figure 8 is a map of the southern portion of Illinois and indicates the extent of the Illinois oil basin. The relative sizes of the various oil fields are shown, together with the new fields discovered in 1958.

b Figures as of January 1, each year.

STONE, SAND, AND GRAVEL

The most important stone product in Illinois is crushed stone from limestone and dolomite. The material is used in the construction industry and for highway and railway roadbed building and maintenance. It is also used in agriculture, the chemical and metallurgical industries, cement and lime manufacture, and for several minor uses.

Preliminary figures for 1958 show that a total of almost 28 million tons of crushed stone was reported produced, the value of which amounted to about 37 million dollars (table 16). Of the 102 counties in the state, 56 counties reported production of crushed stone during the year.

Revised figures for 1957 (table 16) show that Illinois producers reported a little more than 28 million tons of stone quarried, not including stone used in the manufacture of cement and lime. The stone was valued at 38.7 million dollars, an average of about \$1.38 per ton. Illinois counties traditionally leading in the production of crushed stone are Cook, Kankakee, Livingston, Randolph, St. Clair, and Will, with each county generally producing more than one million tons annually.

Agricultural Limestone

Important to both the farmer and the quarry operator is the crushed stone product used as agricultural limestone, commonly called agstone. This stone commodity is important to the farmer because, as crop yields are increased through the use of commercial fertilizers, agstone is required to replenish the calcium in the soil.

The second annual report on Illinois agstone production is presented in table 17. The 1958 agstone figures reported show a greater total tonnage and a higher total value than those shown by the final figures for 1957. Eight of the nine geographical areas of the state (fig. 9) have reported increased tonnages and values for 1958. The highest average value of agstone was reported for the east-southeast section. However, the greatest total tonnage and the highest total value for 1958 have been recorded for the east section.

c For abrasives, ceramics, foundry and filler from ground siliceous material.

Sand and Gravel

Common sand and gravel is used extensively in the construction industry; it also is used in building and maintaining highway and railway roadbeds, and for miscellaneous uses. Preliminary production figures for 1958, revised figures for 1957, and production figures for the years back to 1950 are recorded in table 18 for sand and in table 19 for gravel.

Special sands in Illinois include silica sand and natural bonded molding sand. Silica sand, which is produced in substantial quantities in LaSalle County and in lesser amounts in Ogle County, is a nearly pure quartz sand. Natural bonded molding sand can be used practically as dug for use in making molds for casting metal. Table 20 gives preliminary production figures for 1958 and revised 1957 figures for these special sands.

CLAY PRODUCTS

Clay products include such items as face brick and common brick, sewer pipe and drain tile, flue pipe, building tile, vitreous plumbing fixtures, glazed tile, electrical porcelains, and pottery and whiteware. Also included in the list of clay products are the various forms of special heat-resistant firebrick and silica brick used by the metallurgical industries. Table 21 gives a summary of clay products produced for the years 1957 and 1958. Listed in table 22 are the number of Illinois clay products plants reporting production for 1957 and 1958. The county outline map of Illinois (fig. 9) shows the nine sections into which the state was divided for tabulating this list of clay plants.

Table 21. - Production of Illinois Clay Products, 1957- 1958

FLUORSPAR

Fluorspar is an important raw material for the iron and steel, aluminum, chemical, glass, and ceramic industries. Commercial fluorspar is graded principally according to its content of calcium fluoride and is ordinarily prepared as metallurgical grade, acid grade, and ceramic grade.

United States shipments of finished domestic fluorspar in 1958 amounted to 319,200 tons and was valued at 15 million dollars, according to the U. S. Bureau of Mines. Shipments of finished fluorspar in 1957 totaled 328,900 tons and was valued at slightly more than 15.7 million dollars. National consumption of 494,000 tons of fluorspar in 1958 was 23 percent below the 644,700 tons consumed in 1957. Table 23 gives a summary of the amounts and values of fluorspar shipped from several states and totals for the United States in 1956 and 1957.

A tabulation of the amounts of fluorspar consumed (domestic and foreign) by various states in the United States is given in table 24. During both 1956 and 1957 Illinois was the leading consumer of fluorspar and was one of the states that increased its consumption of this material in 1957 over the amount consumed in 1956.

METALS

The principal metal recovered from Illinois mining operations is zinc. Somewhat smaller amounts of lead are produced, and occasionally very small quantities of silver are reported recovered. Jo Daviess County in extreme northwestern Illinois and Hardin County in southern Illinois are the principal areas of metal production in the state.

Throughout the United States in 1958 the zinc and lead industry was generally characterized by low demand, mounting stocks, large imports, and lower prices, resulting in reduced mine and smelter production. In Illinois during 1958 the mine production of recoverable lead declined to about 55 percent of that produced in 1957. However, due to increased activity on the part of some producers in northern Illinois, preliminary figures for the mine production of recoverable zinc indicate that total tonnage of this metal for 1958 equalled the 1957 production, although the price per ton was lower (table 25).

DIRECTORY OF ILLINOIS INDUSTRIAL MINERALS PRODUCERS

The following pages contain lists of mineral operations of recent record. The lists, arranged by product and by county, are not necessarily complete because of changes in organization, mining location, or other conditions.

The directory is published to help consumers on mineral raw materials locate sources of materials most convenient to them, to answer queries of mine- and quarry-equipment manufacturers, and to give citizens of Illinois information about local industries.

Schoolteachers who use the annual reports for studies of mine mineral resources and conservation also will find the list valuable.
